

TimeS – TimeSheet: Installation Guide

Pre-requisites

TimeS functionality comes with a server part which needs to be installed on the machine on which Team Foundation Server is installed.

TimeS Installation

1. Right click on "TimeSSetup" application and select "Run as administrator"
2. Open the TFS Admin console, open the Application Tier – Administer Security. For the TFS Service identity user give the permission to "Make request on behalf of others". Add all the other permissions too if they are blank.

OR

Use following command to add the TFS Service identity user to "Team

Foundation Service Users" group: `tfsssecurity /g+ "Team Foundation Service Accounts" n:<domain_name\user_name> /server:<SERVER_URL>`

3. Click on Install button for TimeS Server and appropriate message box will be prompted.

Create one inbound rule and one outbound rule for the firewall on TFS machine to allow communication on TCP port 1919 for TimeS to communicate. Without enabling the port 1919 across the firewall on TFS machine, the TimeS application will not be available on machines other than TFS itself.

4. Follow the User Manual for further instructions
